Errors and omissions excepted.

[1] The average power consumption without USB load varies greatly and depends on the use of the interfaces, the GPU and the CPU. It is usually well below 4 W without HDMI.

[2] 1 A USB output current (sum of both USB outputs) is only available with input voltages >11 V. The bridging time of voltage dips of at least 10 ms required by EN 61131-2 is only guaranteed with a supply voltage of 20.4 ...28.8 V. At 12 V input voltage this time decreases drastically, especially when driving loads by USB ports.
